

Aircraft **DISINFECTION SERVICE**

Keeping your aircraft and those who fly within it safe are your top priorities right now.

To that end, Duncan Aviation has implemented an aircraft disinfection process that we are now providing for operators and FBOs. It is available at our three full-service locations and through our Satellite and engine Rapid Response locations.

Here are some facts about our disinfection service:

- Our crews are specially trained to use the disinfectant system and we will schedule the service at our locations or at your hangar or facility.
- The process uses a portable unit that employs an EPA-registered, hospital-grade disinfectant on the aircraft's interior surfaces. The application is either aerosolized, a hands-free mist, or a hand-applied spray, depending on the size of the aircraft.
- The disinfectant solution produces no harmful by-products for the environment, contains no VOCs and is 100% biodegradable. It is non-corrosive and has been proven safe for the various custom surfaces found in business aircraft.

We care deeply about our customers and the communities in which we conduct business and are being proactive in keeping everyone safe.
